

Guidelines for Writing a Bachelor or Master Thesis

Research Group Methods for Big Data
Scientific Computing Center (SCC)
Karlsruhe Institute of Technology (KIT)

Contact: kleinlab@scc.kit.edu | www.kleinlab.de

Ideal Qualifying requirements:

Bachelor:

- 1.) Exam pass in at least one course offered by the *Research Group Methods for Big Data*
- 2.) One satisfactory presentation and regular attendance in the chair's seminar.

Masters:

- 1). Exam pass in at least two courses offered by the *Research Group Methods for Big Data* with a total of at least 7 ECTS. One of the modules must be a lecture.
- 2). One satisfactory presentation and regular attendance in the chair's seminar.

Confirmation by the appropriate examination office is required for the modules passed.

Equivalent courses can qualify for meeting the requirements and needs to be discussed on an individual basis.

Before officially registering for the thesis, an exposé must be submitted and approved by the supervisor.

Exposé

The exposé serves to define and structure the planned thesis project. It ensures that the research question is feasible, scientifically relevant, and sufficiently specified before the start of the thesis. Supervision will only start after a satisfactory exposé has been approved.

Length and format: 2–4 pages, preferably prepared in LaTeX or Overleaf, i.e., shared with the supervisor in an editable format for feedback.

Content:

The exposé should include the following elements:

1. Topic and Motivation
 - Description of the general topic
 - Explanation of its relevance and context
2. Related Work / Literature
 - Overview of relevant literature
 - Positioning of the planned work within existing research
3. Research Question
 - Clearly formulated scientific question or hypothesis
4. Objectives
 - Mandatory goals of the thesis
 - Optional extensions (if applicable)
5. Expected Outcome
 - Anticipated results or findings
 - Practical or theoretical benefits
 - "What-if" scenarios (e.g., what if the hypothesis is not confirmed?)
 - Limitations and implications of possible outcomes
6. Methodology / Work Plan
 - Description of the planned methods (e.g., statistical analysis, machine learning models, simulations)
 - Concrete steps of the project
7. Timeline
 - Realistic schedule for the thesis duration

Note:

The time required to prepare the exposé is not part of the official thesis duration.

Aim of the thesis:

The purpose of the final thesis is to show that you can appropriately solve a problem at hand using statistical and/or deep learning (DL) methods. For a bachelor thesis, this typically means answering a research question using data-analytic methods. For a master thesis, the problem should be more complex, involving, for example, a method extension, a method implementation, a simulation to compare the performance of methods, and/or advanced methods that require independent literature research. Specific requirements regarding depth and scope will be agreed upon individually for each thesis.

The evaluation of the thesis is based on the following aspects:

- 1.) *Form*: Have the formatting instructions been observed? Is the thesis well written and understandable? Are all figures and tables meaningful and correctly labelled? Is all notation introduced and consistent? Are there any typing mistakes, grammatical errors, or incomplete sentences? Are used references correctly cited and word-for-word citations correctly marked as such?
- 2.) *Statistics*: Are all used statistical methods clearly and correctly explained in the author's own words? Are the statistical methods appropriate for the problem at hand? If simulations are used, are these well conducted, clearly described and the results well summarised? If methods are extended, are the extensions reasonable, well-motivated and fitting to the problem?
- 3.) *Deep Learning*: Are all used deep learning methods clearly and correctly explained in the author's own words? Are the model architecture and training procedures appropriate for the problem at hand and well-justified? If uncertainty quantification or model extensions are employed, are they correctly implemented with proper theoretical foundations? Is model evaluation comprehensive with appropriate metrics and proper data separation?
- 4.) *Application*: Is the data well described and are the problems of interest clearly stated? Are the problems adequately translated into statistical questions? Have the problems presented been adequately answered? Is the interpretation of the results correct, complete and understandable?

Requirements of content and form of the thesis:

- 1.) The work should present the author's competence in the subject and their ability to independently handle and process data with the help of software (for example Python, SPSS, Matlab, R, etc.).
- 2.) The thesis should include the following components:
 - Title page
 - Table of contents
 - List of abbreviations (if necessary)
 - List of figures & tables (if any)
 - List of formulae & symbols (if any)
 - Main body
 - Bibliography
 - Appendix (if any)
 - Declaration of Academic Honesty
- 3.) Formulae:
 - If necessary, you should make required line breaks according to a formula generated by calculator and, where possible, not separate bracketed expressions.
 - Intertemporal considerations require the indication of time indices for all dynamic variables.
 - For complex parenthetical expressions, round, square and curly brackets may be used for better clarity of layers of presentation.
 - The exact differentiation of symbols used must be guaranteed.
- 4.) Tables:
 - Graphic design according to individual preferences.
 - Correct factual, temporal, and spatial arrangement of the presented numbers.
 - Table headings may contain subdividing blocks.
 - Line by line breakdown by indent of subpoints up to a maximum of three steps.
 - The first header element should also be used to identify a subdivision of the column elements; this can be divided diagonally and labelled accordingly.

- Tables should be comprehensible without accompanying text.
 - If abbreviations, remarks, or sources are necessary, these should be reflected in corresponding footnotes and the words "derived from..." should be appended to the source. Complementary tables and figures, that are too large for presentation within the main body of text or that are not explicitly addressed in the text, should be moved to the appendices.
- 5.) The thesis should be written in LaTeX using the KIT template (<https://kit-cd.km.kit.edu/presentationen.php>); use the defaults for your document class.
- 6.) References and Citations: Use the American (author–year) referencing system. In LaTeX, manage references with natbib and cite with `\citep{key}` for parenthetical citations, e.g. (Carlan et al., 2024), and `\citet{key}` for textual ones, e.g. Carlan et al. (2024). Always cite the primary source. Every word-for-word quotation must be marked as such and attributed. Keep all references in a single .bib file and follow the rules below from the start, they are required by many target journals, keep manuscripts consistent, and ensure entries are complete.
- Entry label (citation key). First three letters of each author's surname, followed by the publication year: Carlan, Kneib, Klein (2024) → CarKneKle2024
 - Entry type. Use the correct type:
 - @article: journal articles
 - @book: books
 - @inproceedings: conference papers
 - @unpublished: arXiv preprints
 - others as needed (@phdthesis, @techreport, ...)
 - Completeness. Include all relevant details:
 - Journal articles: volume, issue (number), page range
 - Books: publisher, edition (if applicable)
 - Conference papers: venue, location, date
 - Capitalization:
 - Protect proper nouns in titles with braces so BibTeX keeps the casing, e.g. title = `{\B}ayesian Analysis of {\G}aussian Processes`
 - Article/paper titles: sentence case ("This is a paper title")
 - Book/journal titles: title case, and preserve the journal's own capitalization ("Journal of Statistics", not "Journal of statistics")
 - Page ranges. Use an en-dash --: pages = `{345--357}` (not 345-357).
 - arXiv preprints. Use @unpublished and provide the arXiv identifier so it appears as a clickable link, e.g. note = `{arXiv:\href{https://arxiv.org/abs/2104.02705}{2104.02705}}`
- 7.) Important tables or figures should be integrated into the text (not into the Appendix). Each table or figure should not exceed one page.
- 8.) Any variation of the above regulations will only be permitted with prior approval.
- 9.) All sources, quotes, cited graphics or tables etc. should be clearly identified. The thesis will be checked for plagiarism, and if found, the work will be graded as "failed".

10.) Final presentation: After submitting the final version of the thesis, the student must give a final presentation of the thesis. The final presentation should focus on the research question and objectives, employed methodology, results, and the conclusion. The final presentation should last no longer than 15 minutes, with an additional 5 minutes dedicated to a discussion as well as questions from the audience. The final presentation's slides must be created using the KIT template (<https://kit-cd.kit.edu/presentationen.php>). Slides for the presentation must be handed in one week before the presentation.

Guidelines for thesis submission:

- The duration of the thesis preparation (writing) period is defined by the current study regulations; the submission deadline must not be exceeded.
- One printed (hardcopy) version of the work must be submitted to the secretary at SCC, Frau Karin Rische, before the deadline, with the title of the work and the author's name and student ID clearly visible on the cover (front) page.
- The work is also to be submitted to Prof. Nadja Klein in a pdf format by the author, thereby enabling the grading process to start as soon as possible.
- All analyses presented in the thesis must be reproducible. All code (including necessary explanations) is to be submitted electronically.
- See https://www.informatik.kit.edu/faq-wiki/doku.php?id=masterarbeit_allg and https://www.informatik.kit.edu/faq-wiki/doku.php?id=bachelorarbeit_allg for more general information.
